

# **Inter-Annual Simulations with SoFLA-HYCOM and Comparison to in-situ Data**

**Ge Peng, Villy Kourafalou, Rafael Schiller, and Tom Lee**

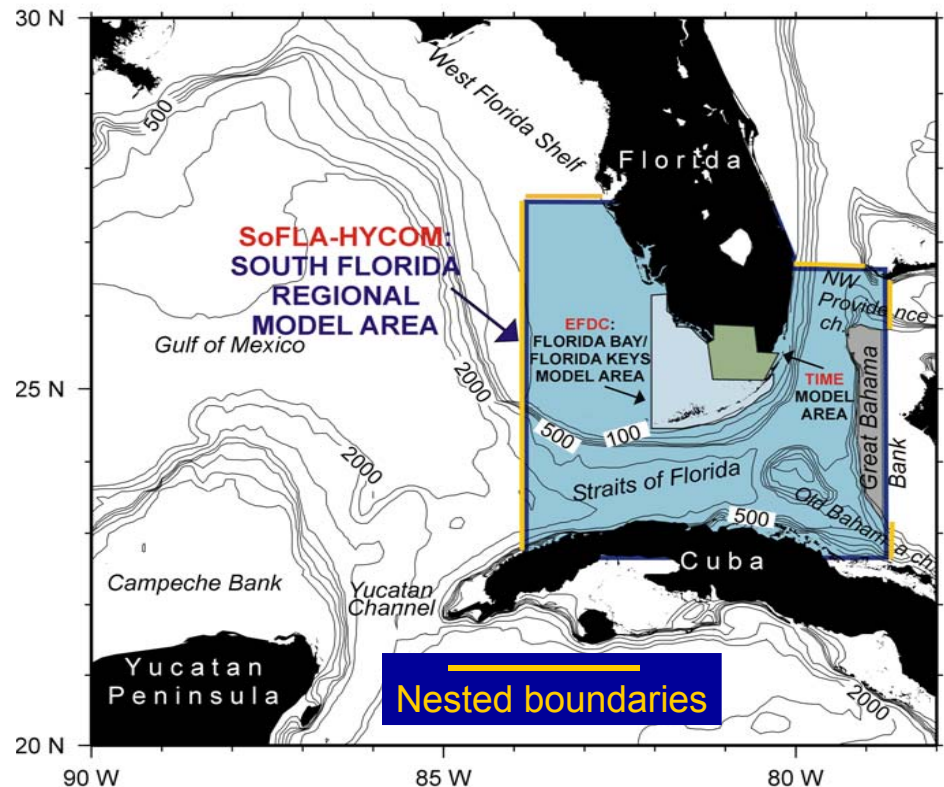

**In Collaboration with**

**Elizabeth Williams and George Halliwell (RSMAS)  
Pat Hogan, Ole Martin Smedstad , and Alan Walcraft (NRL)**

# SoFLA-HYCOM

## Regional FLAe0.04 model

- HYCOM version 2.1.27
- Domain (83.76W-78.8W; 22.59N-27.45N ) is nested within N.ATLd0.08 (1/12°)
- Simulation from Sept 1999 to Dec. 2002 with **NOGAPS** and **daily rivers** from a hydrological model
- **Free running** - no data assimilation
- Improved local topography with 5 m minimum water depth

The goals are to examine the capability of HYCOM in simulating coastal currents on the SW FL Shelf and to provide boundary conditions to the FL Bay/KEYS models.

# Coastal features in nested model

layer=01 velocity date: jul 18, 2002 [11.2H]

**NA-HYCOM**

No wind-driven  
coastal current

Drifter trajectory for ID # 21008  
Dec 09, 1998 to Mar 31, 1999

layer=01 velocity date: jul 18, 2002 [01.4H]

**SoFLA-HYCOM**

Improved topography &  
horizontal resolution

→ better wind-driven  
coastal current.

# Geographic Locations of Data and Model Points

▲: moorings; ●: c-man

DT: Dry Tortugas; LK: Looe Key;

san: Sand Key; smk: Sombrero Key;

SR: Sharker River

CR: Caloosahatchee River.

Station ID	type	Lon (°w)	Lat (°N)	Water Depth (m)	Model Depth (m)*
A1	buoy	81.336	25.1657	6.4	5.36
B1	buoy	81.653	25.1672	11.58	13.34
B2	buoy	80.355	25.093	7.0	14.798
C2	buoy	80.318	25.073	21.8	31.18
LK	buoy	81.40	24.542	24	56.8
san	C-MAN	81.88	24.45		
smk	C-MAN	81.11	24.63		
mlr	C-MAN	80.38	25.01		

\*: Model point is the closest model point to the data point but may not be collocated with data points.

# Model-Data Comparison: Time Series

Winds at: 81.88W 24.45N Sand Key

Variables: 81.34W 25.166N Buoy A1

Variables: 81.65W 25.167N Buoy B1

Date

- Currents on the SW FL shelf are largely wind-driven
- In response to atmospheric forcing, the currents (both model and observations) display more fluctuations during winter season (November – May) than during summer season (June – October).

# Model-Data Comparison: Statistics

Station A1

Station B1

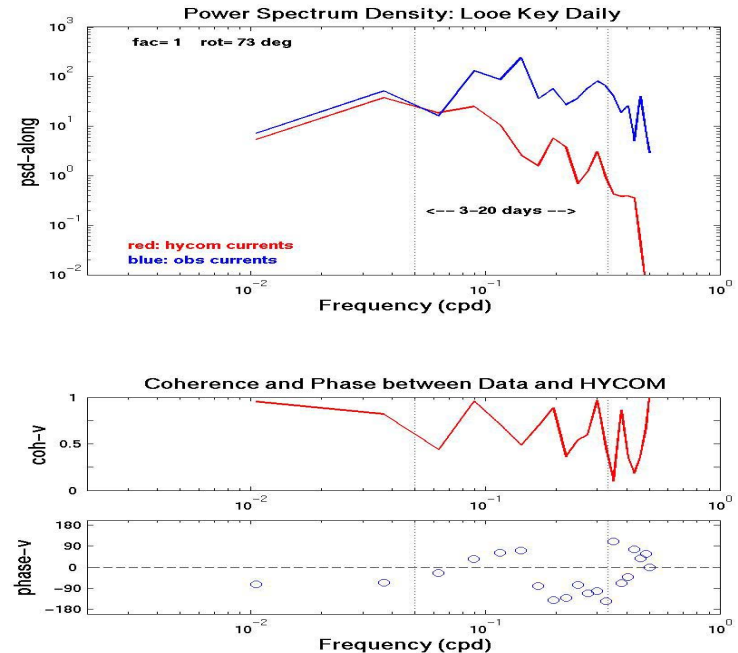

- Energy peaks are in phase over all
- No obvious phase bias between model and data at these two locations
- The maximum cross-correlations occur at the zero lag which are above 99% significant level for both locations
- The model current distribution has a positive bias in both Station A1 and B1 than observations for the period.

# C-MAN Winds at Sombrero and Currents at Looe Key

10/99 – 4/00 73° rotation

The similar results are found for B2 and C2 buoy stations at the Upper Keys.

Model currents have energy comparable to observations in low-frequency band but less energetic for the synoptic bands → other factors rather than winds play important role.

## **Conclusion on Data-Model Comparison**

- **The model currents on the SW Florida Shelf are in good agreement statistically with the observations. No phase between the two are found. However, the model currents have a positive bias in magnitude.**
- **Model currents compare better with the observations on the SW Florida Shelf than along the Straits.**

## **Conclusions on New SoFLA (FLAh0.04) Domain**

- **The nesting between FLaH0.04 and GOMh0.04 works well**
- **The NCODA run shows very promising signs in improving the positions of the Loop Currents and eddies along the FL Straits and magnitudes of currents on the SW FL Shelf**

## **Future Work with New SoFLA Domain**

- **In-depth analysis of impact of data assimilations to event simulations such as eddy-passages and hurricanes**
- **Impact of daily fresh water flux associated with river discharges**
- **Comparison to observations**
- **High resolution domain ( $1/50^\circ$ )**
- **High resolution atmospheric forcing**
- **Impact of tides**

**END**
